C

Computer Repair Management System

User Guide — how to use the software

blessing-communication-technolog.vercel.app

Everything you need to log a repair, track it, bill it and report on it.
Read this once and you will know the whole system.

1. What this software does

This is a **Computer Repair Management System (CRMS)**. It replaces the paper records and scattered spreadsheets a repair workshop normally uses. Everything lives in one place:

- **Customers** — who brought a device in, and their contact details.
- **Repair jobs** — what came in, what is wrong with it, who is fixing it and how far along it is.
- **Spare parts** — what is in stock, what has been used, and what needs reordering.
- **Invoices** — what the customer owes and what they have paid.
- **Reports** — how the workshop is performing.

The system also **messages the customer automatically** every time their repair moves forward, and gives them a page where they can check the status themselves.

What is in this guide

1. What this software does
2. Signing in — website address and login details
3. Finding your way around
4. The repair process, start to finish
5. Everyday tasks, step by step
6. Repair statuses explained
7. How customers track their own repair
8. Who is allowed to do what
9. Problems and answers

2. Signing in

Website address

Open this address in any web browser, on a computer or a phone:

Staff (workshop) sign in	`https://blessing-communication-technolog.vercel.app`
Customer repair tracking	`https://blessing-communication-technolog.vercel.app/track`

Login details

There are two kinds of user. **Staff sign in. Customers do not.**

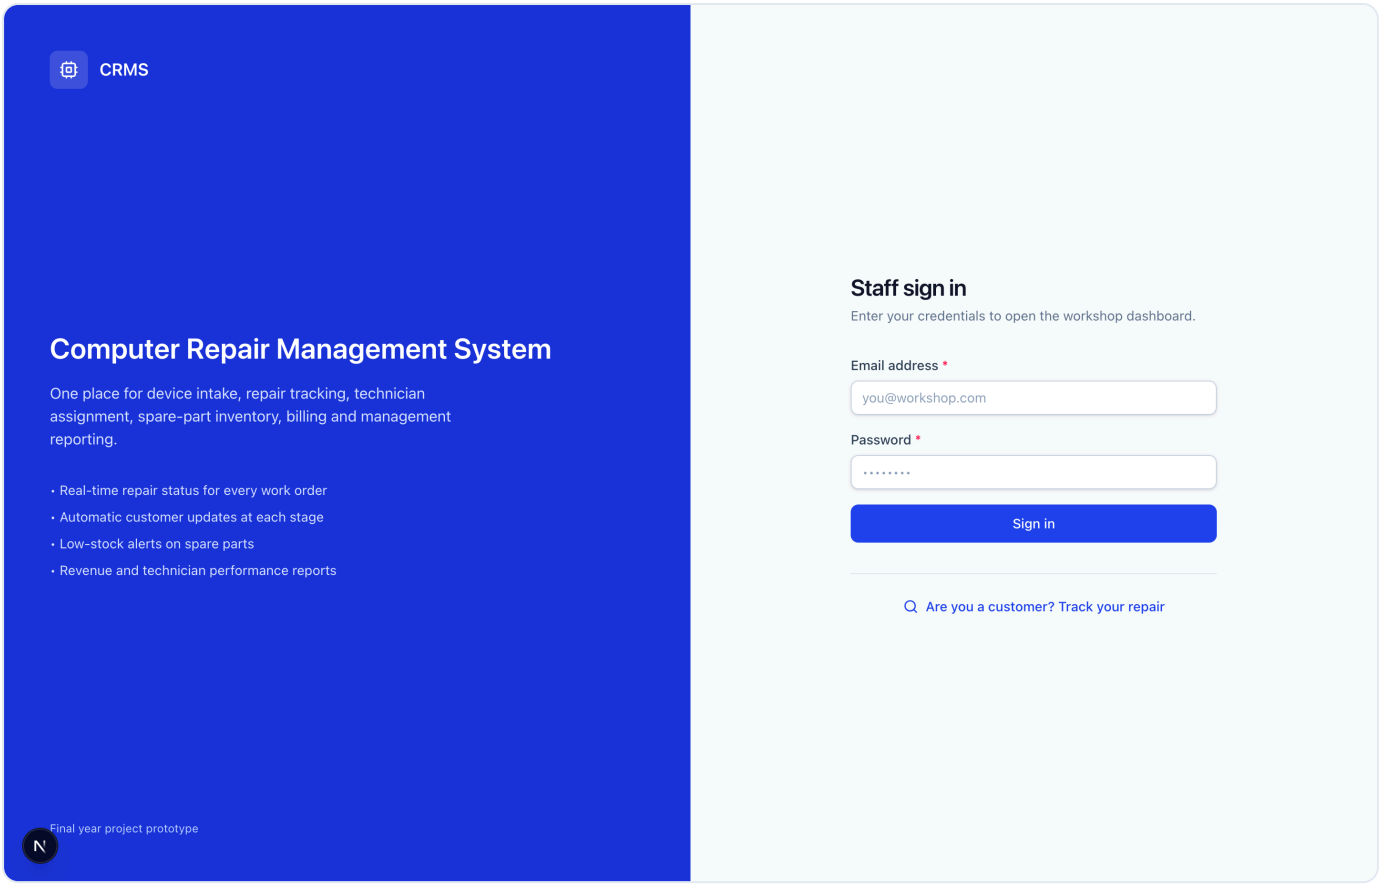

Role	Email	Password	What they can do
Administrator Blessing Adeyemi	`admin@crms.test`	`password123`	Everything: all repairs, staff, inventory, invoices and reports.
Technician Tunde Bakare	`tunde@crms.test`	`password123`	Only the repairs assigned to them.
Technician Amaka Nwosu	`amaka@crms.test`	`password123`	Only the repairs assigned to them.
Technician Ibrahim Sani	`ibrahim@crms.test`	`password123`	Only the repairs assigned to them.

> **Important.** These are demonstration accounts and the passwords are publicly known. Before using the system with real customer information, sign in as the administrator, go to **Staff**, and create fresh accounts with private passwords — then disable these ones.

How to sign in

1. Open the website address above. You will land on the sign-in screen.
2. Type the email address and password from the table.
3. Click **Sign in**. You will land on the Dashboard.

To leave, click **Sign out** at the bottom-left of the screen. You stay signed in for 8 hours.

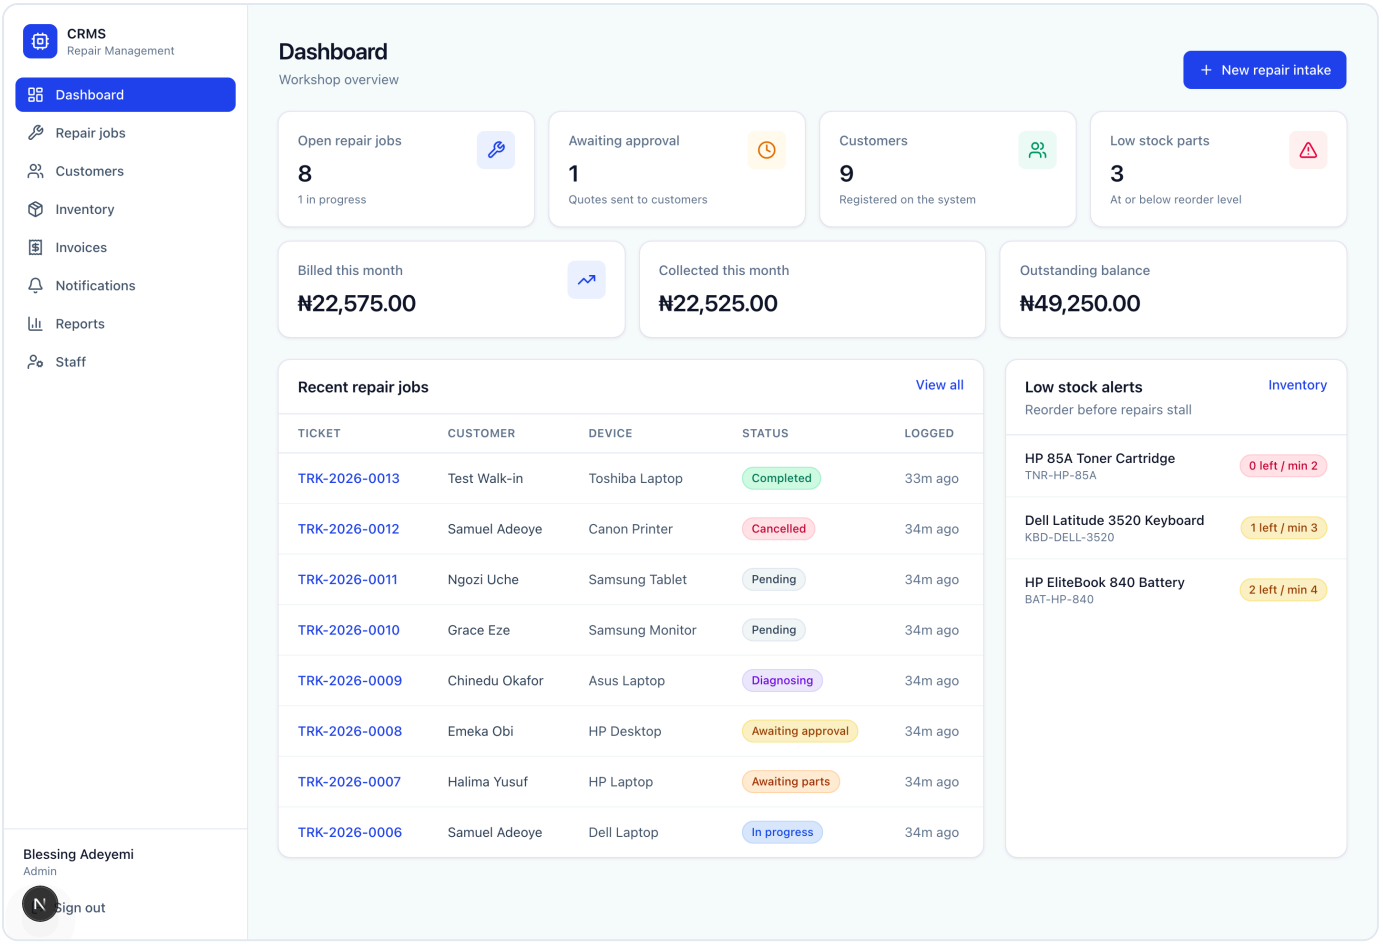

The sign-in screen. Customers use the link at the bottom instead.

3. Finding your way around

The dark menu down the left-hand side is how you move around. It is always there. On a phone, tap the ≡ button at the top to open it.

Menu item	What you use it for
Dashboard	Your home screen. How many jobs are open, what needs attention, money in and out, and low stock warnings.
Repair jobs	Every work order. Search, filter by status, and open any job to work on it.
Customers	Register a customer and see everything they have ever brought in.
Inventory	Spare parts: how many are left, prices, and adding new stock.
Invoices	Bills raised, what has been paid, what is still owed. Printable.
Notifications	Every message the system has sent to a customer.
Reports Admin only	Charts and figures: repair trends, revenue, technician performance.
Staff Admin only	Create, enable and disable the accounts that can sign in.

The Dashboard. The four boxes at the top are your at-a-glance numbers.

> **Tip.** Anything shown in **blue text** can be clicked. Ticket numbers like `TRK-2026-0006` open the full repair job.

4. The repair process, start to finish

Every repair follows the same path through the system:

#	Stage	What happens
1	**Device comes in**	You fill the intake form. The system creates a tracking number and texts/emails the customer.
2	**Technician diagnoses**	The technician inspects it and writes down what is actually wrong.
3	**Quote is sent**	You enter labour and parts cost. The customer is told the price.
4	**Customer approves**	You record their approval. Only then can work start.
5	**Repair is done**	Parts are fitted — stock reduces automatically. Work is written up.
6	**Invoice and payment**	The invoice builds itself from the labour and parts recorded. You take payment.
7	**Device handed back**	Mark it delivered. The job is closed.

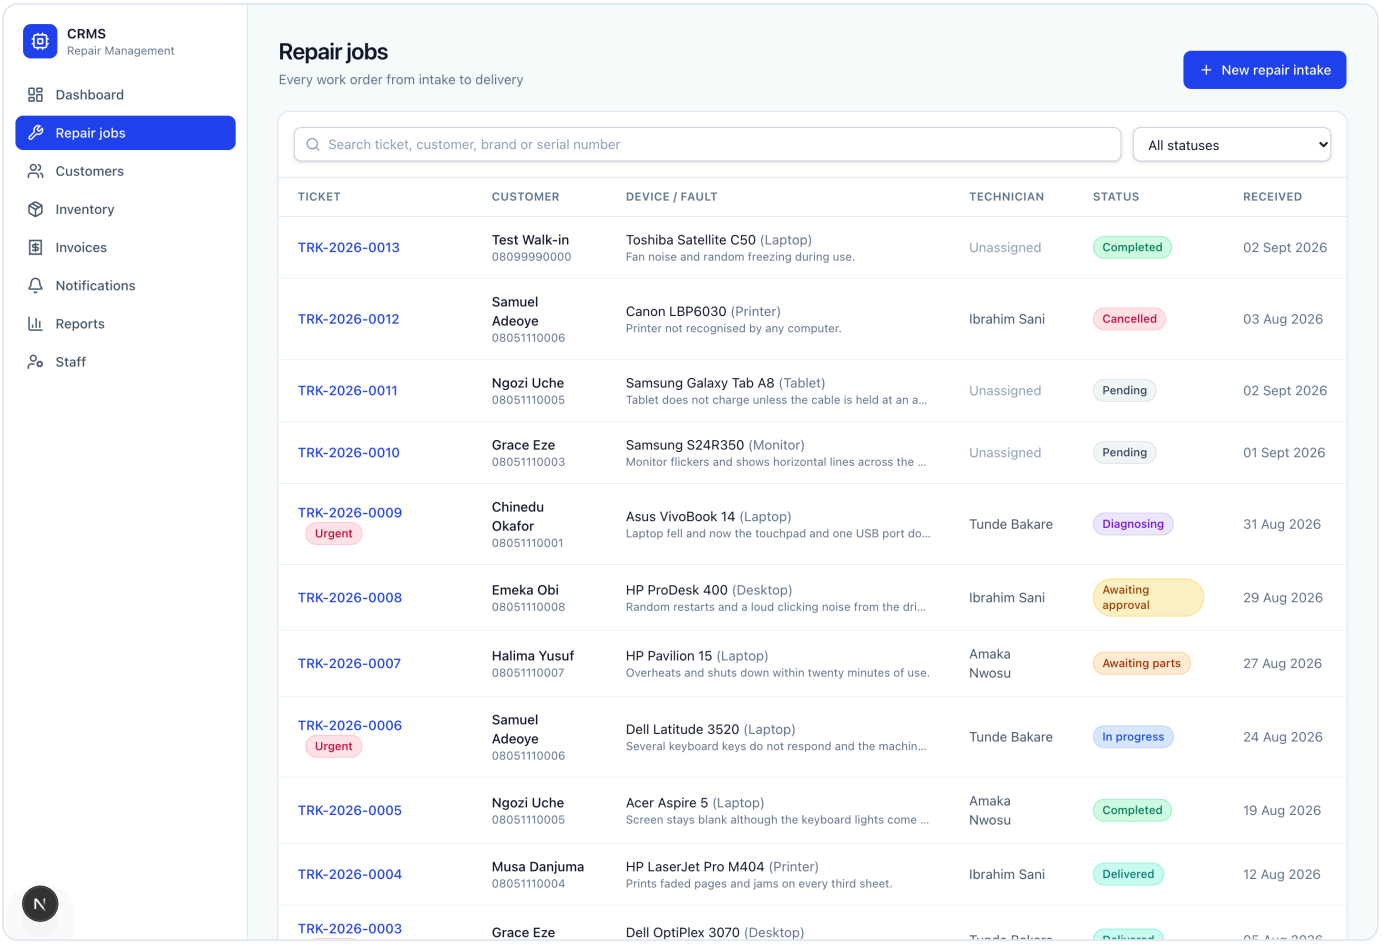

The system protects you. You cannot skip a stage, cannot start work before the customer approves the price, cannot invoice a repair that is not finished, cannot use a part you do not have, and cannot take more money than the invoice is for. If you try, it explains why in plain words.

5. Everyday tasks, step by step

A. Logging a device that has just come in

1. Click **Repair jobs**, then the blue **New repair intake** button.
2. Under **Customer**, choose **New customer** and type their name, phone and email — or choose **Existing customer** and pick them from the list.
3. Under **Device details**, record the type, brand, model, serial number, anything they left with it (charger, bag) and any existing damage.
4. Under **Reported fault**, write the problem in the customer's own words.
5. On the right, set the priority, assign a technician if you know who will handle it, and set an expected completion date.
6. Click **Create work order**.

Give the customer their tracking number. It looks like `TRK-2026-0014` and appears at the top of the job. They use it to check progress themselves without phoning you.

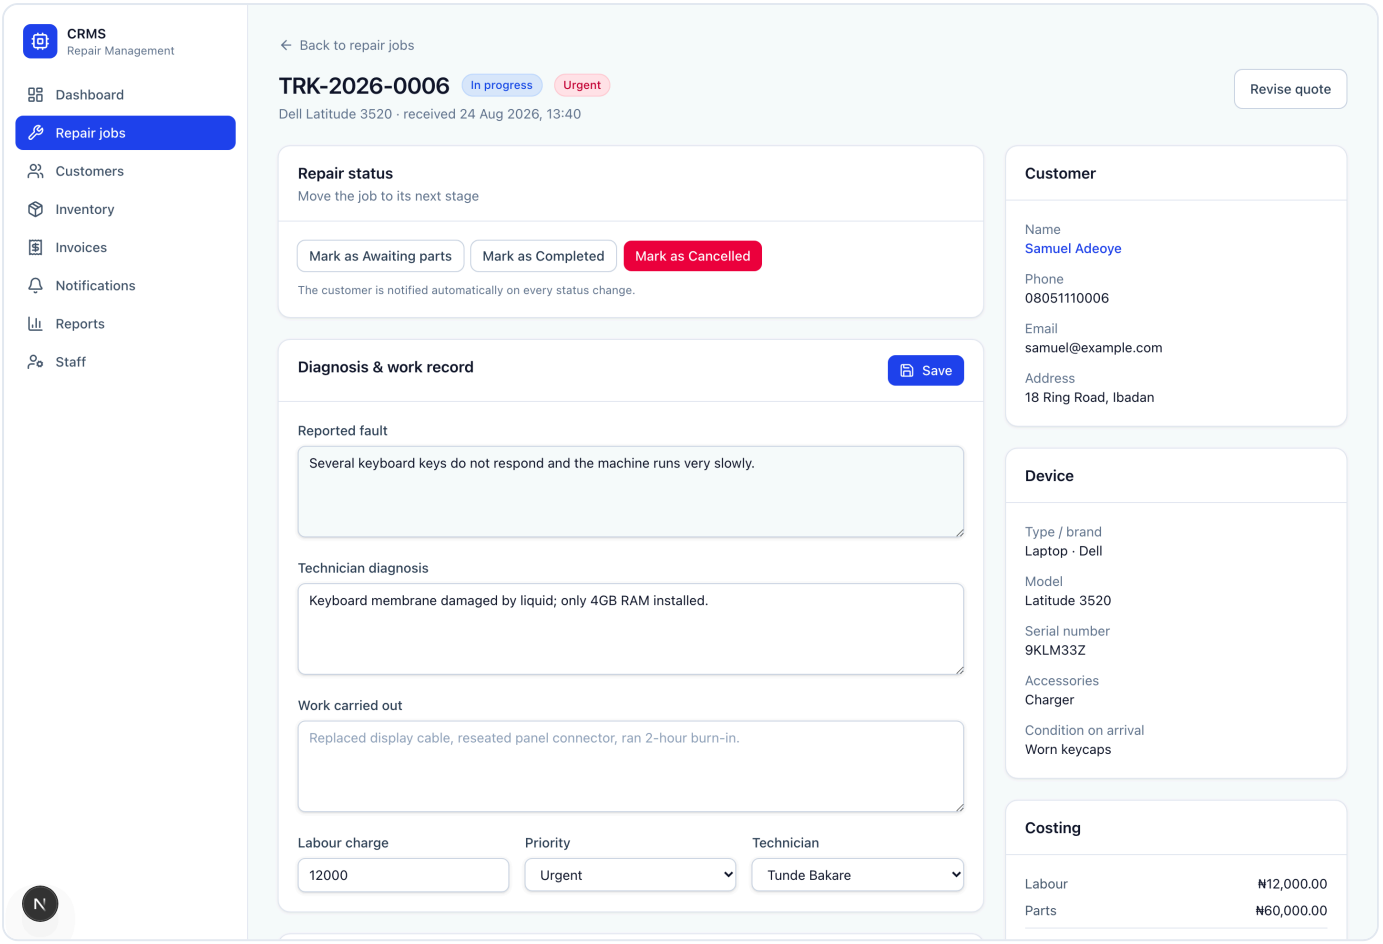

The Repair jobs list. Search by ticket, customer, brand or serial number.

B. Working on a repair

Click any ticket number to open its work screen. Everything about that repair is here.

1. **Move it forward.** The **Repair status** box at the top shows only the stages you are allowed to move to next. Click one, add a note for the customer, and confirm.
2. **Write your findings.** Fill in **Technician diagnosis** and **Work carried out**, set the labour charge, then click **Save**.
3. **Fit a part.** In **Spare parts used**, click **Add part**, pick it and enter how many. Stock drops automatically. The bin icon returns a part to stock if you added it by mistake.
4. **Check the history. Job history** at the bottom shows every change, who made it and when.

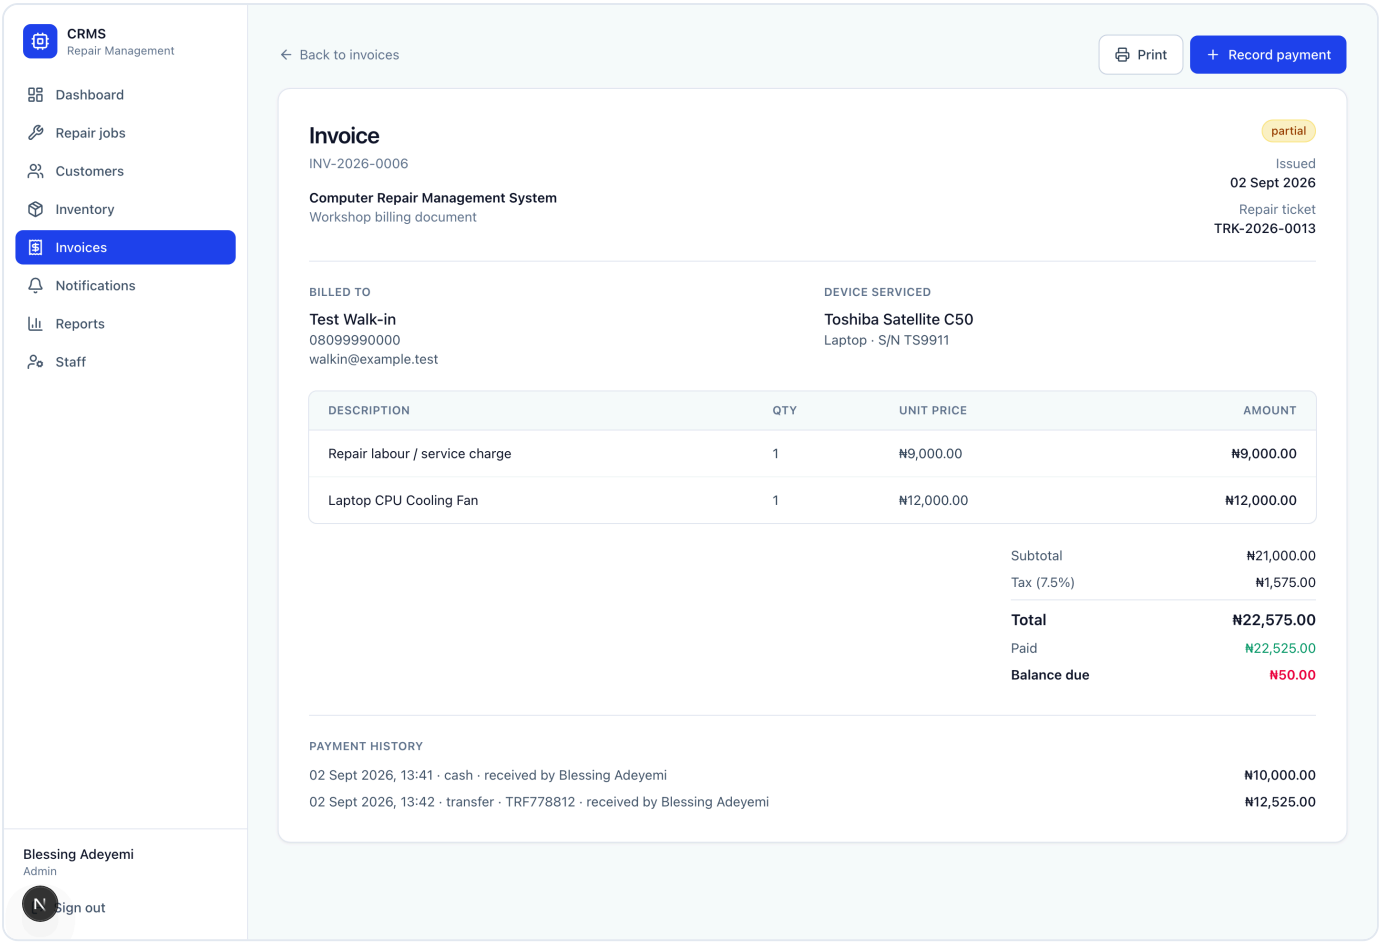

The repair work screen. Customer, device and running cost stay on the right.

C. Quoting a price and getting approval

1. On the repair screen, click **Prepare quote** (top right).
2. Enter the labour cost and the estimated parts cost. The total is worked out for you.
3. Click **Send quote**. The job moves to **Awaiting approval** and the customer is told the price.
4. When the customer agrees, click **Approve quote**, type who approved it, and confirm.
5. The job moves to **In progress** on its own. Work can now begin.

D. Billing and taking payment

1. Finish the repair and mark it **Completed**.
2. Click **Generate invoice**. The invoice is built automatically from the labour charge and the parts you recorded — you do not retype anything.
3. Add a tax rate or discount if needed, then click **Generate**.
4. Open the invoice and click **Record payment**. Enter the amount and how they paid. Part payments are fine — the balance updates.
5. Click **Print** to give the customer a copy.
6. When they collect the device, go back to the repair and mark it **Delivered**.

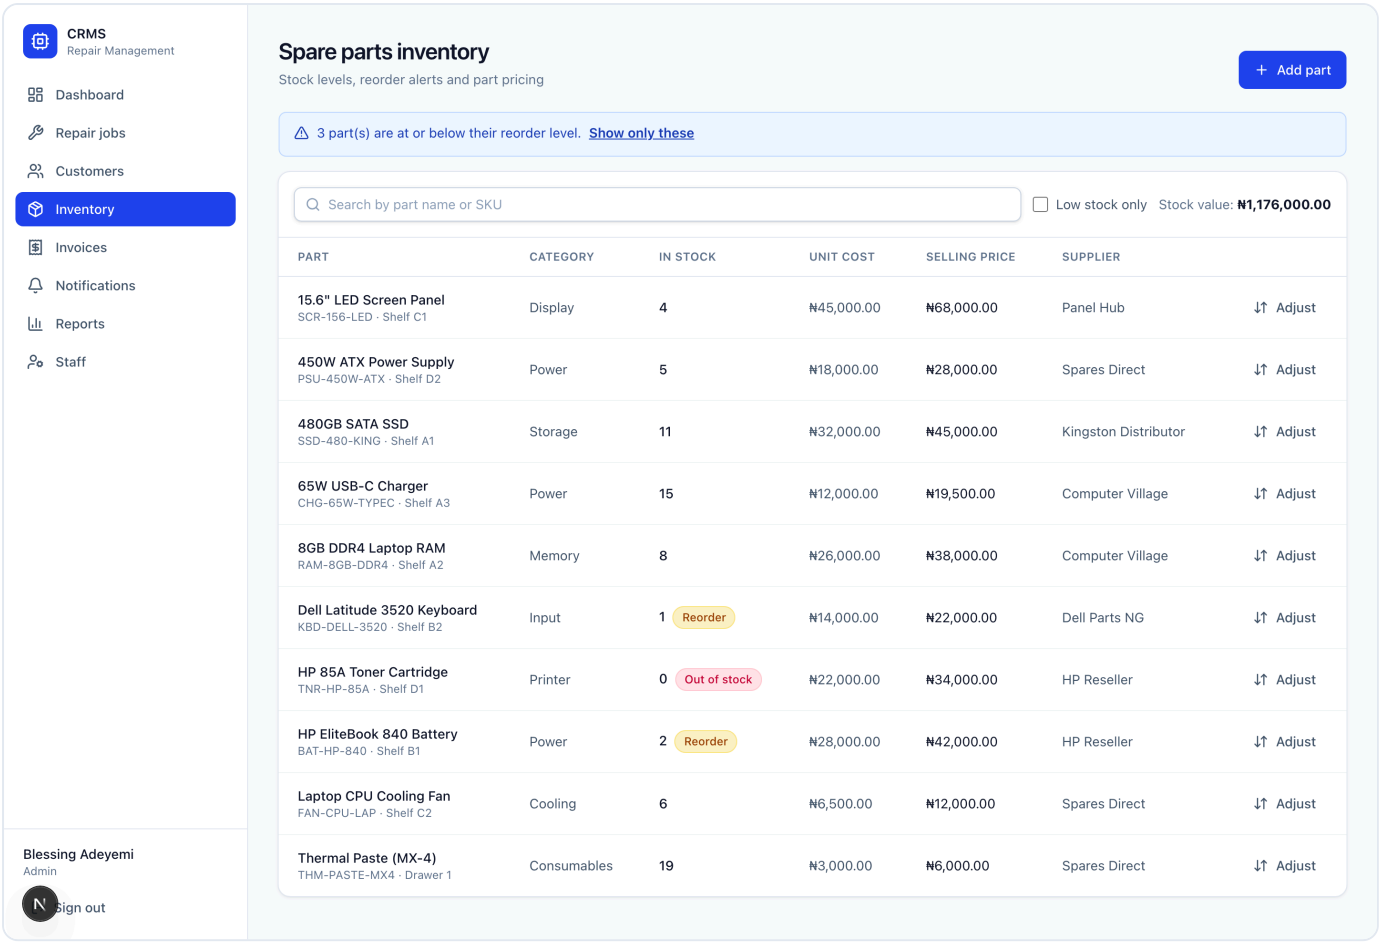

An invoice, ready to print.

E. Looking after spare parts

1. Click **Inventory** to see every part and how many are left.
2. **Add part** registers something new. The **reorder level** is the number at which the system starts warning you.
3. **Adjust** changes the stock count. Enter a positive number for stock received (e.g. `10`) or a negative number to write stock off (e.g. `-2`), and give a reason.
4. Tick **Low stock only** to see just the parts that need reordering.

> Parts fitted to a repair come off stock automatically — you never adjust for those by hand. Every single change is recorded with a reason, so the count can always be explained.

Inventory. Red and amber tags mark parts that are out or running low.

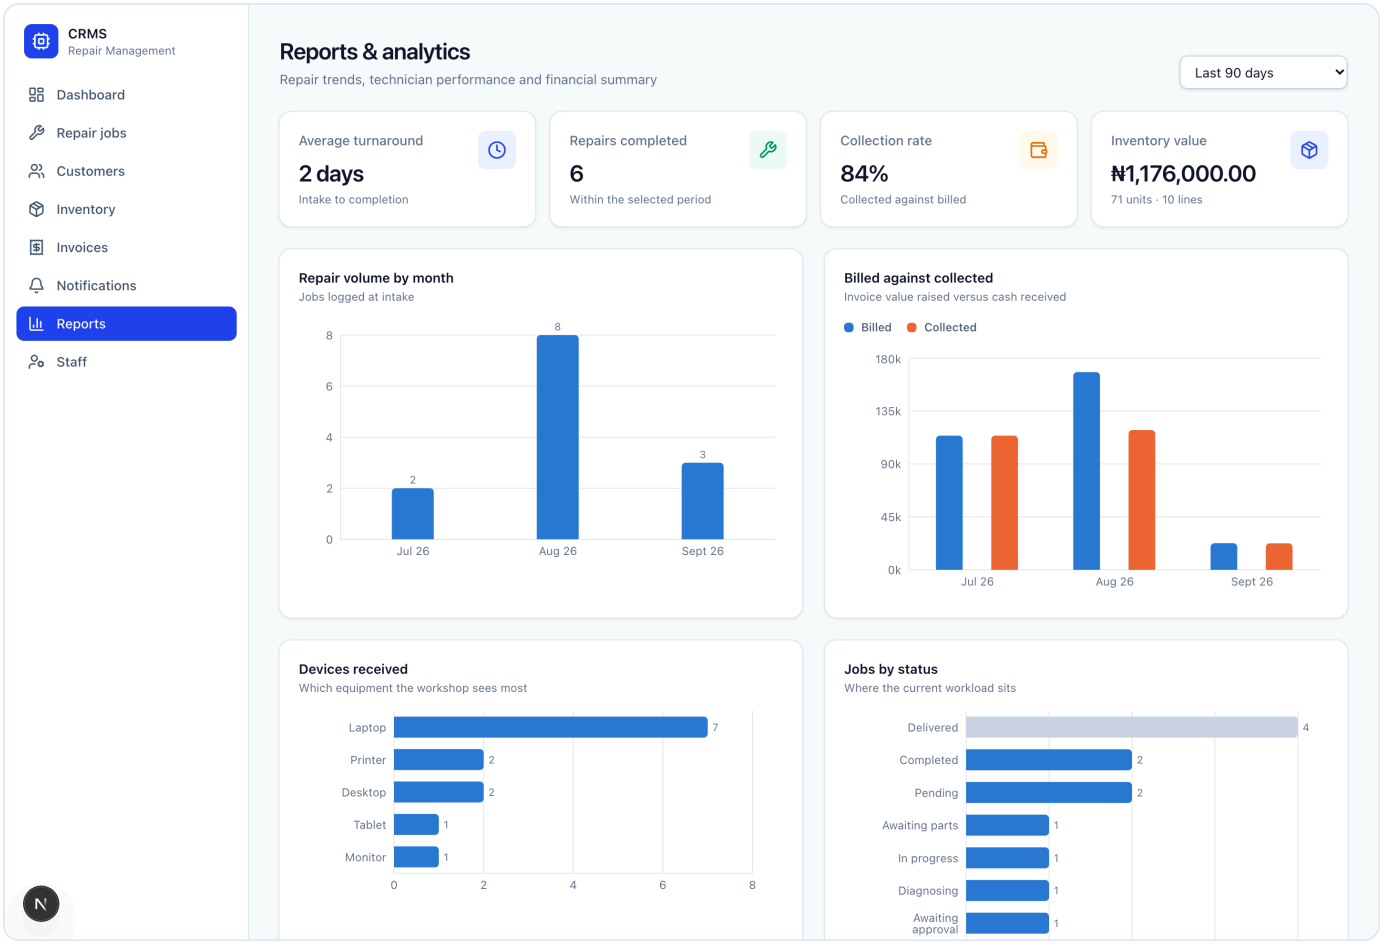

F. Registering a customer on their own

You normally do not need this — the intake form registers a new customer for you. But if you want to add someone in advance, click **Customers** then **Register customer**. Opening a customer shows every repair they have ever brought in.

G. Reading the reports Administrator only

Click **Reports**. Use the box at the top right to change the period.

What you see	What it tells you
Average turnaround	How long a repair takes from arrival to completion.
Collection rate	How much of what you billed has actually been paid.
Repair volume by month	Whether the workshop is getting busier or quieter.
Billed against collected	Money raised versus money received, month by month.
Devices received	Which equipment you see most, so you stock the right parts.
Technician performance	Jobs handled, completion rate and speed per technician.
Fastest-moving parts	What you use most and should never run out of.

Reports. Hover any bar on screen to see the exact figure.

H. Managing staff Administrator only

1. Click **Staff**, then **Add staff**.
2. Enter their name, email, a password of at least 6 characters, and choose Technician or Administrator.
3. Use **Disable** when someone leaves — this keeps their work history but stops them signing in.

A technician with open jobs cannot be deleted. Reassign their jobs first. You also cannot remove your own administrator access, so you can never lock yourself out.

6. Repair statuses explained

The coloured tag on every job tells you where it is.

Status	Meaning
Pending	Device received, waiting for a technician to look at it.
Diagnosing	A technician is inspecting it now.
Awaiting approval	The price has been sent. Waiting for the customer to say yes.
In progress	Approved, and the repair is being done.
Awaiting parts	Paused while a spare part is sourced.
Completed	Fixed and ready for the customer to collect.
Delivered	Handed back. The job is closed.
Cancelled	The repair will not go ahead.

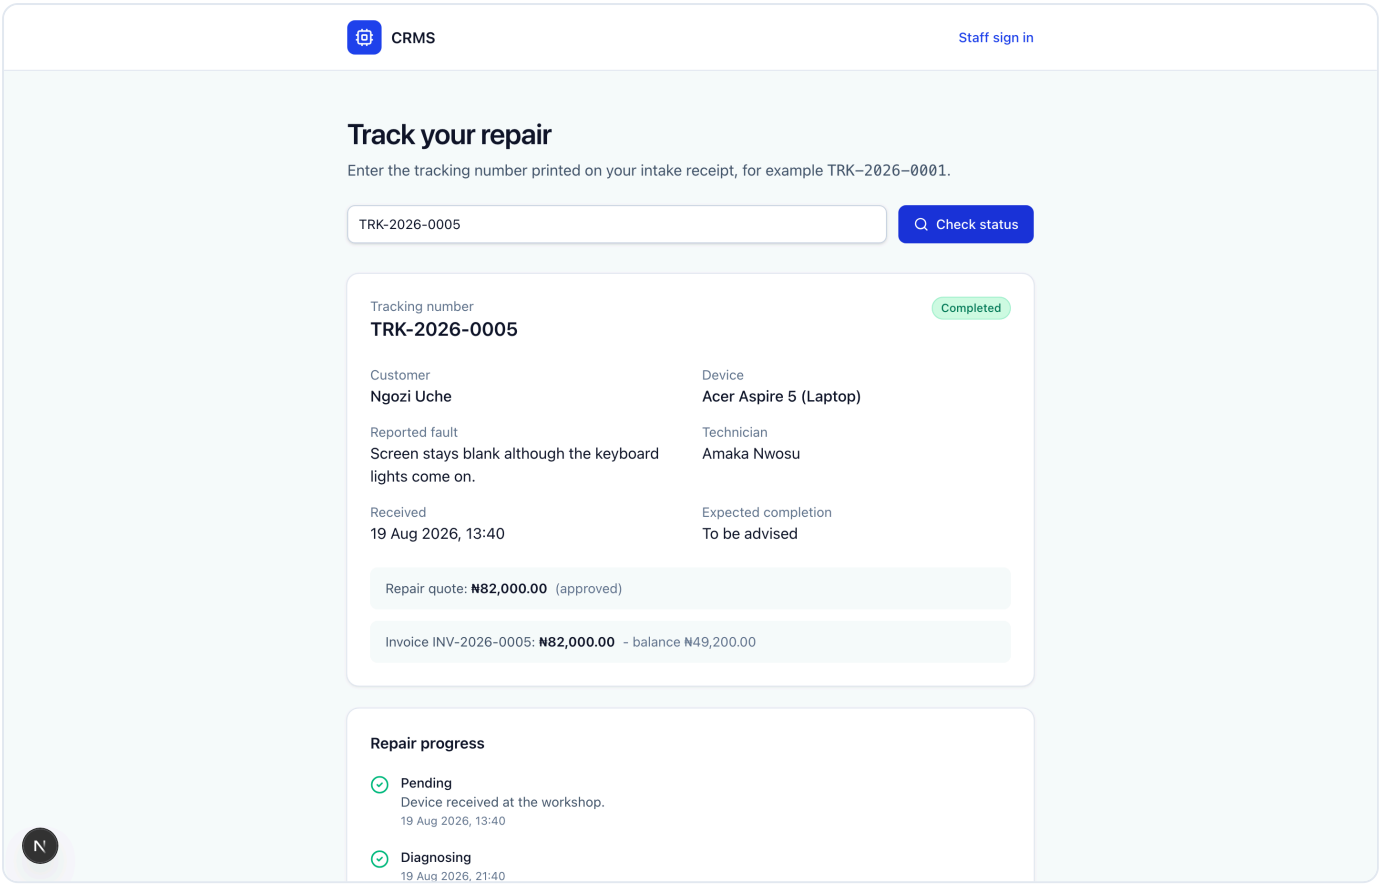

7. How customers track their own repair

Customers never sign in and never need an account. Give them their tracking number and this address:

`https://blessing-communication-technolog.vercel.app/track`

1. They type in their tracking number, for example `TRK-2026-0005`.
2. They see the current status, the device, who is repairing it, the quote and the balance owed.
3. They see a progress list of every stage completed so far.

They see **only their own repair** — no other customer's details, no internal notes and no staff information. On top of this, the system emails them automatically at every stage, so most of the time they do not need to check at all. Everything it has sent is listed under **Notifications**.

What the customer sees. No login, no account, no phone call needed.

8. Who is allowed to do what

Action	Administrator	Technician
See all repair jobs	Yes	Only their own
Log a new device at intake	Yes	Yes
Update diagnosis and status	Yes	On their own jobs
Quote and record approval	Yes	On their own jobs
Fit spare parts to a job	Yes	On their own jobs
Reassign a job to someone else	Yes	No
Register and edit customers	Yes	Yes
Add parts or change stock levels	Yes	No (can view)
Generate invoices, take payment	Yes	Yes
View reports	Yes	No
Create and disable staff accounts	Yes	No

9. Problems and answers

What you see	What to do
"Invalid email or password."	Check for typing mistakes and stray spaces. The password is case sensitive.
You keep being sent back to the sign-in screen	Your 8-hour session ran out. Sign in again.
"A job cannot move from X to Y."	Repairs must follow the proper order. Use one of the buttons the system offers you.
"The customer must approve the quote before work can begin."	Click **Approve quote** and record who approved it first.
"Only 3 of that part left in stock."	You asked for more than you have. Reduce the quantity or add stock under Inventory.
"Complete the repair before generating an invoice."	Mark the repair **Completed**, then invoice it.
"That is more than the outstanding balance."	You cannot take more than is owed. Check the balance shown on the invoice.
"This customer has 3 repair jobs and cannot be deleted."	Deliberate — deleting them would destroy repair history.
"No repair found with that tracking number."	Check the number. It looks like `TRK-2026-0005`.
Reports or Staff are missing from the menu	You are signed in as a technician. Those are administrator-only.

Before real use. Change every password from `password123`, and never share database or server settings with anyone who only needs to use the website. This guide contains sign-in details for people, not system settings.
